DESCRIPTORS: *Turbine blades, *Shafts, Stability,
Deflection, Thermal stresses, Thermal expansion.

An analysis shows that residual deflection of rotors
and shafts at high temperatures during operation are
caused by formation or relaxation of internal residual
stresses. Thermal instability of quality forgings is
not an irremovable defect. Thermal instability is
elastic thermal deformation at high temperatures. It
can be produced by the action of internal residual
stresses with an asymmetrical distribution diagram.
