Within Tgt Object "L" is something scanning/rotating within close tolerances inside a cowling. An impression of windings and electromagnetics is present, "like" the object is functioning within or in conjunction with electro-magnetic/magnetic field(s). The object is not frequently attended by people--as if it can be controlled and performs its functions remotely from human supervisors/controllers; in fact, such distancing may even be desirable. There are no "housing functions" internally for people, that is there are no control or work spaces. There is a strong AI produced, "like" in the process of whatever this object does it gives off something that's very unpleasant for humans to be around--something which is very intense.

"Testing", "simulation", "burst", and "energy" are all concepts that are associated with the object. An AOL/S of an EMP burst simulator was immediately suggested. It's as if "L" is intended to provide some sort of effect that is useful in accomplishing some "other objectives" (a Stage 5 or "other objectives" provided the following terms and concepts: equipment, machines, devices, effects, people; electronic, hard; defense, military, civilian, technology, chemical, instrumental, R&D, survivability, commutating, hardening, attritional, quality control)--"L" does not represent an end in itself.

A contrast and comparison between "C" and "L" suggests that L is older, smaller (though not necessarily in size or dimensions), with less capacity. Shapes are slightly different.

In some way C is has more "density," and is used for "mainline" operations, while L is used for miscellaneous related chores. Both objects are unusually heavy for their apparent volume and size. C is more sophisticated, up-to-date, precise, "accurate", or refined than older L. However, from the original

~~description, L has received new, more developed internal components: "armature", "coupling", "relays", "click-on, click-off" impressions associated with this context. "Use" of L has not changed--still fills same general function, though now it's used for change--they come in, they're done, they go on to wherever their final destinations are. There is a fairly wide range of use for L but all uses are along basically the same lines. The "improved" L doesn't do things differently, just more efficiently.~~

54/2 between "C" + "L" - one is older, smaller, less capacity (smaller not necessarily in size). Shops are slightly different. Same concept as when they get a larger, more precisely engineered, more capable telescope star observer - 6.55m telescope takes over main missions on they do new things they couldn't do before. Older one is still used & useful in smaller projects; for grad students; doing more routine mapping things + search things I don't have time for before.

54/2 "C" has more capacity more "density" use for "mainline" ops, larger scale "production"
