

The target is an extremely large freighter. There is something odd or unique about the stern. The hull is two tone; a red lower section & light gray upper section. The superstructure is light gray or dirty white, as is the smoke stack. The stack is ~~rather~~ slanted & the oval is slanted. It also has a red bar midway up. The character "30" or "B0" appears somewhere on the vessel. The superstructure ~~may be split~~ fore & aft or is either a split bridge type or a fore bridge w/ a large object on deck near the stern. The vessel has two self contained cranes or support/loading systems mid ship. The vessel is rather old. The vessel is carrying a large quantity of manganese. The concentrate is located in two large areas of the ship (see diagram). There will be an transfer at sea. The concentrate will be off loaded via a large side door into smaller metal hulled vessels. This transfer will occur w/ i sight of land and in an area of numerous small islands. Nearby beaches sand bars are extremely white and of extremely fine grained sand/soil. This is a very profitable operation. The words/phrases associated with this operation are DUTSA DOBSA, SAN DOBOSO, DOBOSO, SANTA DE BASA or DE BASO, and de Muellan.
