"war gaming"

Site involves object that is being evaluated for

dependable/appliable/stable application & phenomena involved. Object is not yet "practicalized" - but is being evaluated for possible production & general use.

It is "hooked-up" to monitoring/evaluation equipment which controls conditions applied to object and controls also what object does, but also keeps people involved in experiment continually aware - "fed-back" - of what is going on with object. Object is high-tech/electronic, utilizes either a known phenomenon in a novel way or an unknown phenomenon (or even a ~~unknown~~ known phenomenon in a previously unthought of way).
