FRANCE

France is ready to equip one of its three operational ballistic missile submarines with the country's first megaton thermonuclear warhead, Defense Minister Bourges announced on Tuesday.

[redacted] Bourges told newsmen that France's other operational missile submarines will have the new warhead by the end of the year.

The Redoutable, which has just re-entered service after completing a 15-month overhaul, probably will be the first to receive the warhead. The Redoutable, whose 16 missiles now have 450-kiloton warheads, had been scheduled to carry some of the new 1-megaton warheads when it re-entered service [redacted]

[redacted] In any case, it is unlikely that any submarine will have a full load of the warheads before the end of this year. [redacted]
